Standard of care: All medications are given together under directly observed therapy (DOT). Medications are administered seven (7) days per week for at least the first two weeks of therapy. Then medications may be administered five (5) days per week by DOT, with the remaining two doses self-administered over the weekend. Intermittent therapy is generally not recommended. Ethambutol can be discontinued when drug susceptible to INH and RIF is demonstrated. Pyridoxine (B-6) is given with INH to those at risk of neuropathy (e.g., pregnant women, breastfeeding infants, persons infected with human immunodeficiency virus [HIV], patients with diabetes, alcoholism, chronic renal failure or malnourished and those who are of advanced age).

MONITORING ORDERS

1. Beginning with the second week of therapy, collect one sputum sample weekly and send to WSLH for smear and culture.
2. Assess the patient at least weekly for side effects and medication toxicity. Hold medications and call clinician if present.
